## Notes

"Cement effect" finish: finish obtained by cement-based materials applied manually, after sanding the surface, through different phases: 2 layers of primer coating applied with a brush and roller; 2 layers of the cement applied with a specific spatula each stage is spaced by a 24h drying cycle, and further sanding before proceeding to the next phase — and final phase of 2 protective finishes, applied with a brush, as stain-resistant treatment, which prevents the immediate absorption of stains.

The cement finish is furthermore protected with an acrylic paint finish, which provides the surface a good scratch resistance. A subsequent application of nano-molecular varnish, protects the finish from chemical agents, especially of food nature. The handicraft and preciousness of this application, creates finishes and surfaces which may differ from each other for finishing and shades of colours. This feature shows the exclusivity and craftsmanship of each creation.
